1. Tool Overview and Architecture

DeskFlow is a productivity tool for IT support professionals, created to centralize, organize, and accelerate the use of phraseologies, scripts, and operational resources during L1, L2, and L3 support.

Operating in BYOD (Bring Your Own Data) mode, 100% in the browser, DeskFlow does not maintain a centralized database with the user's phraseologies, settings, and signatures: these data remain stored locally, under the control of whoever uses the tool.

The platform is publicly available at:

<https://deskflow-blush.vercel.app>

Tip: Bookmark this address in your browser or, even better, configure it in the sidebar — see Part II of this manual for the complete step-by-step guide for Opera, Firefox, Edge, and Chrome.

2. Main Features and Operational Highlights

Smart Search & Hashtags

Search by terms, text words, or specific hashtags (e.g., `#VPN`, `#365`, `#Password`). Results are filtered in real-time as you type, without the need to reload the page.

The search combines multiple terms with "AND" logic: you can type a hashtag followed by a keyword to restrict the result to cards that meet both conditions simultaneously. For example, **"#mfa reset"** filters only the phrases marked with the tag/category *mfa* that also contain the word *reset*; **"#wpp greeting"** finds, among the phrases marked with *#wpp*, those dealing with greetings.

To explicitly restrict the search, use the prefixes `category:` (or `cat:`, `c:`) and `tag:` (or `t:`). For example, **"category:power pending"** searches for the term "pending" only within the *power* category; **"tag:mfa reset"** does the same restricting it to the *mfa* tag.

By clicking on a frequent tag or a tag displayed inside a card, it is automatically inserted in the `#tag` format in the search bar — and you can continue typing other terms without losing this filter (e.g., **"#mfa unlock"**). Clicking again on the same tag removes only that tag from the search.

Tip: Regardless of the combination used (`#tag term`, `category:term` or `tag:term`), the pinned phraseologies of that result always appear first, highlighted at the top, followed by the other phrases that meet the filter.

1-Click Copy with Automatic Signature

When clicking on "Copy", the phraseology text is immediately copied to the clipboard with the analyst's personalized signature appended to the end — ready to paste into the ticketing system or chat.

Phrase Pinning (Pin/Favorites)

Pin your most-used phraseologies to the top of the catalog by clicking the thumbtack/pin icon, ensuring ultra-fast access during support peaks.

Category Management and Sorting

Organize phrases into custom categories by support group (e.g., L2/L3, VPN, Hardware). Reorder, create, or delete categories according to your team's routine.

Context Tags

Each phraseology can receive multiple tags (e.g., #12 , #13 , #incident , #forward) that accelerate both search and communication standardization across support tiers.

3. Service Workflow Step-by-Step

Step 1 - Locate the Desired Phraseology

Use the top search bar by typing the keyword, or click directly on the frequent hashtag tags (#VPN , #Password , #Printer).

Step 2 - Adjust Variables/Placeholders (if any)

If the phrase has fields in brackets, such as [Name], [Protocol], or [Link], quickly edit the text before copying, or replace the values directly in the ticket after pasting.

Step 3 - Copy and Paste into the Ticket / Chat

Click the blue "COPY" button. The system will display a confirmation notification, and the message — already with the signature attached — will be ready to be pasted into the Service Desk, email, or corporate chat.

Step 4 - Create / Edit New Phrases

To add new team standards, click on "+ New Phrase", define title, category, tags, and the standardized content. Existing phrases can be adjusted at any time via the pencil icon.

4. Signature, Document Import, and Storage

Configure Personal Signature

Access "Storage & Sync" > "Signature" tab. Define your name, role, and phone/support center. This signature is automatically appended to all copied phrases, ensuring standardization and traceability of the support provided.

Smart Document Import (100% Local)

In the "Import" menu, it is possible to paste texts or load files in .txt and .json formats. All processing occurs locally, in the analyst's browser and in the application's internal server, using deterministic algorithms in TypeScript (regular expressions, block division, and document readers) — no content is sent to external artificial intelligence services.

When the file follows the pattern recognized by DeskFlow — blocks separated by an isolated line with three hyphens (---), initiated by the fields **Title:**, **Category:**, and optionally, **Subtitle:** — the reading engine automatically recognizes these elements, in addition to the tags (#) provided on the last line of the block. For free text without this pattern, the system performs a segmentation by paragraphs, allowing the analyst to review and organize the new phraseologies before saving.

Tip: DeskFlow does not use BYOK (Bring Your Own Key) or any integration with generative AI — the routines and storage of external API keys have been disabled and removed from the application. Sensitive ticket data, internal procedures, and test credentials remain in the user's environment throughout the entire import process.

Reading Model: Converting Texts with AI Support

To convert loose notes, scripts, or old phraseologies to the pattern recognized by DeskFlow before importing, use the prompt below in any AI assistant of your choice (ChatGPT, Copilot, Gemini). The conversion happens in the assistant chosen by the user, outside of DeskFlow — the tool only reads the already formatted .txt file, without any AI step internal to the import process.

You are an IT technical documentation assistant. I need to convert my support notes and scripts into the standard DeskFlow format (.txt). ### DESKFLOW FORMAT RULES: 1. Separate each phraseology with exactly three hyphens on an isolated line: --- 2. Each phraseology MUST contain: Title: [Clear title of the phraseology] Category: [Printers, Networks, Hardware, Software, Accesses or other] Subtitle: [Short summary of the phrase] (optional) [Full Text / Procedure] #tag1 #tag2 #tag3 (tags starting with # on the last line) #### OUTPUT EXAMPLE: Title: Print Spooler Restart Category: Printers Subtitle: Queue clearing and local service restart 1. Press Windows + R and type: services.msc 2. Locate the "Print Spooler" service and click Stop. 3. Access the folder: C:\Windows\System32\spool\PRINTERS and delete all files. 4. Go back to services and click Start the Print Spooler. 5. Perform a test print. #printer #spooler #queue #driver #test --- Title: Port Check on Switch Category: Networks Subtitle: Physical connectivity and link down diagnostics

```
1. Check the indicator LED of the corresponding port on the patch panel and switch. 2. Make sure the RJ45 network cable is properly locked in the connector. 3. Test cable integrity with a continuity tester if necessary. 4. If the LED remains off, switch to a spare port on the same VLAN. #switch #network #port #link #vlan #cable --- Title: Desktop RAM Replacement Category: Hardware Subtitle: Boot and beep diagnostics procedure 1. Disconnect the power cord and discharge static from the equipment. 2. Remove memory modules and clean contacts with a soft eraser. 3. Test one module at a time in each slot to isolate potential bus failures. 4. Turn on the desktop and verify if POST completes without alert beeps. #hardware #memory #ram #desktop #post #maintenance --- ### TASK: Transform all my raw texts below exactly into the format above, identifying the titles, defining the best categories, and generating useful #tags for searching: [PASTE YOUR TEXTS HERE]
```

Tip: Paste your raw texts in place of "[PASTE YOUR TEXTS HERE]" before sending the prompt to your chosen assistant. Save the result as a .txt file and import it directly into DeskFlow.

Standardized Export (.txt)

The "Export" button compiles all active responses into a single clean, human-readable text file. Each item receives explicit headers (title, category, and tags) and blocks are separated by dashed lines — an ideal format for attaching to internal wikis (Confluence, Notion), Git repositories, or operational manuals, which can be re-imported later by DeskFlow itself.

Local Storage and Cloud Synchronization (Optional)

By default, DeskFlow follows the local-first model: data resides in the analyst's browser `localStorage`, which ensures the portal opens and responds instantly without relying on a network connection.

Teams wishing to share a standardized catalog can optionally enable cloud synchronization (Firestore) in the Storage menu. In this case, the phraseology base is persistently recorded and shared among the team's analysts.

Tip: Cloud synchronization is optional and does not involve AI services — it is merely a database to share the catalog among the team. Even so, when activating it, evaluate your organization's internal information security policies regarding data stored outside the local browser.

5. Shortcuts & Best Practices Summary

Operational Action	How to Execute in DeskFlow	Expected Result
Copy Phrase	Click "COPY" on the card	Text + signature in the clipboard
Pin Phrase	Click the Thumbtack/Pin icon	Phrase kept at the top of the list
Edit Phrase	Click the Pencil icon	Opens quick edit modal
New Phrase	Click "+ New Phrase"	Opens registration form
Filter by Tag	Click the tag (e.g., #VPN)	Filters phrases for that tag instantly
Tag + Term	Type #tag term (e.g., #mfa reset)	Filters by tag AND keyword at the same time
Search by Category	Type category: term (or cat:/c:)	Restricts the search to the informed category
Explicit Tag Search	Type tag: term (or t:)	Restricts the search to the informed tag
Local Backup	Click "Export" > Download	Generates JSON/TXT backup file
Quick Access	Pin DeskFlow to browser sidebar	Consult without switching tabs during support

Tip: Keep phrases updated and use the "Export" button weekly to ensure an updated backup of all team phraseologies.

6. Next Steps

+PRODUCTIVITY+DESKFLOW

SIDEBAR CONFIGURATION

7. Introduction: DeskFlow in the Sidebar

DeskFlow was developed to work perfectly in a narrow vertical mode, serving as a productivity aid pinned to the browser's sidebar. Thus, the analyst keeps the phraseology catalog always visible next to the ticketing system or chat, without needing to switch between tabs.

This part of the manual first introduces contextual search — the way DeskFlow combines hashtags and terms to locate phraseologies quickly — and then the step-by-step sidebar configuration for the four most used browsers: Opera (recommended, as it has native support), Mozilla Firefox, Microsoft Edge, and Google Chrome.

Tip: Combine DeskFlow in the sidebar with an AI assistant (ChatGPT, Copilot, or Gemini) also pinned. This way, you can consult additional ideas or get support for daily tickets without leaving the main screen.

8. Contextual Search: Context + Term

Before configuring the sidebar, it is worth understanding the mechanism that makes the search follow the analyst's reasoning during support: first the scenario, then the specific need.

Hashtags can represent the operational context of a phraseology — a support channel, a system, a recurring situation. By combining a hashtag with an additional word, the result is restricted to that context and that term at the same time.

Tip: The examples and screens below use a fictitious catalog and environment, created solely for demonstration purposes in this documentation.

Example: "chat" context

Searching only for "#chat" returns all phraseologies associated with this context — with pinned items always at the top of the result.

[Figure 1 - Search for "#chat": isolated context, with pinned phraseologies at the top (fictitious environment).]

Adding a term after the hashtag — for example, **"#chat fw"** (forward) — restricts the result even further within that same context.

[Figure 2 - Search for "#chat fw": "chat" context combined with the term "fw" (fictitious environment).]

Other contexts (fictitious example)

The same reasoning applies to any other operational context in the catalog. In a fictitious example scenario, **"#power"** isolates phraseologies from that context, and **"#power access"** combines the context with a specific term without needing to manually browse the entire catalog.

Explicit Prefixes

When it is necessary to explicitly restrict the search, the prefixes `category:` (or `cat:`, `c:`) and `tag:` (or `t:`) direct the search exactly to that subset — for example, **"category:power"** or **"tag:chat"**. Full details are in Part I, section "Smart Search & Hashtags".

Recommended Usage Flow

1. Identify the ticket in progress.
2. Identify the context: channel, system, or situation.
3. Type or select the corresponding hashtag (e.g., #chat).
4. Complement with a specific term, if necessary.
5. Locate the right phraseology — pinned items appear first.
6. Copy the content, already with the configured signature.
7. Return to the ticket and paste the response.

9. Quick Browser Comparison

Browser	Sidebar Support	What is needed
Opera	Native — recommended	No extension; use "Custom site panels"
Firefox	Native (panel), but no support for external web pages	"Open in Sidebar" extension
Microsoft Edge	Via extension	"Sidebar" extension
Google Chrome	Via extension	"Page Sidebar" extension

10. Opera Browser (Recommended)

NATIVE SIDEBAR

Opera has a native sidebar and allows you to add both custom sites and AI assistants (Copilot, ChatGPT, Gemini), making it the simplest and recommended option for DeskFlow.

Step 1 - Enable and locate sidebar settings

1. Open Opera Settings and, in the top search field, type "sidebar".
2. In the "Sidebar" section, check the "Show sidebar" option.
3. It is also recommended to enable "Automatically hide sidebar" so it only appears when needed.
4. Then, click on "Manage sidebar" to proceed with the configuration.

[Figure 3 - Opera Settings: search for "sidebar", display, and sidebar elements.]

Step 2 - Select displayed elements

On the "Manage sidebar" screen, check which tools you want to use (e.g., ChatGPT, Gemini, Calendar, Gmail). It is important to keep the last option on the list, **"Sidebar setup"**, always checked, as this allows you to add DeskFlow as a custom panel.

[Figure 4 - "Manage sidebar" screen: selection of tools and AI assistants.]

[Figure 5 - Confirm that the "Sidebar setup" option is checked at the bottom of the list.]

Step 3 - Add DeskFlow as a custom panel

1. On the Opera sidebar, click the three dots ("...") at the bottom.
2. Scroll to the "Custom site panels" section and click "Add custom site panel".

[Figure 6 - Menu (1) and "Add custom site panel" option (2).]

3. A window will appear asking for the panel URL. Paste the DeskFlow address: **https://deskflow-blush.vercel.app/** and click "Create".

[Figure 7 - "Custom site panels" window: paste the DeskFlow address and click "Create".]

Step 4 - Confirm and use

After creating the panel, a new DeskFlow icon should appear in the Opera sidebar. If it does not appear automatically, verify that the item is marked as active (filled blue circle) in the panel list.

[Figure 8 - Item "deskflow-blush.vercel.app" added and activated in the sidebar.]

✓ **Result:** Simply click the DeskFlow icon in the sidebar to open the phraseology catalog side-by-side with your ticketing system and favorite AI assistants.

[Figure 9 - DeskFlow opened in the Opera sidebar, next to the ticketing system (fictitious environment).]

11. Mozilla Firefox

EXTENSION REQUIRED

Firefox has a native sidebar; however, it does not allow you to directly load a custom web page like DeskFlow. Therefore, it is necessary to install a complementary extension.

Step 1 - Enable the native side panel

1. Go to Settings > Tabs and browsing.
2. In the "Browser layout" field, check the "Show side panel" option.

[Figure 10 - Firefox Settings: enabling "Show side panel".]

Step 2 - Install the "Open in Sidebar" extension

Since the native Firefox panel does not open external web pages, install the free **"Open in Sidebar"** extension:

<https://addons.mozilla.org/en-US/firefox/addon/open-link-in-sidebar/>

1. After installing the extension, right-click on the tab where DeskFlow is open.
2. In the context menu, select the option **"Open Page in Sidebar"**.

[Figure 11 - Tab context menu with the "Open Page in Sidebar" option.]

Step 3 - Confirm the result

✓ **Result:** DeskFlow is now pinned to the Firefox side panel, available at any time alongside the rest of your browsing.

[Figure 12 - DeskFlow opened in the Firefox side panel via "Open in Sidebar" (fictitious environment).]

12. Microsoft Edge

EXTENSION REQUIRED

In Edge, the custom sidebar is enabled by the "Sidebar" extension, available in the official Edge add-ons store.

<https://microsoftedge.microsoft.com/addons/detail/sidebar/mkpocmgodenhehajmmnjaenjmpdlllap>

Step 1 - Install the extension

Access the link above and click "Get". After installation, a new side panel icon will be available on the Edge toolbar.

Step 2 - Configure the DeskFlow address

1. Open the "Sidebar" extension panel by clicking its icon on the Edge toolbar. On first use, it appears blank, with an address field ("url") at the bottom of the panel.
2. In the "url" field, type or paste the DeskFlow address: **<https://deskflow-blush.vercel.app/>**
3. Click "Go".

[Figure 13 - Blank "Sidebar" panel with the "url" field at the bottom ready to receive the DeskFlow address.]

Step 3 - Confirm the result

✓ **Result:** DeskFlow is loaded directly into the Edge side panel — with search, tags, and workspace — becoming available next to the ticketing system in use.

[Figure 14 - DeskFlow loaded in the Edge side panel, next to the ticketing system (fictitious environment).]

13. Google Chrome

EXTENSION REQUIRED

Chrome does not have a native sidebar for external pages. The free extension "Page Sidebar - Open any page" solves this limitation:

<https://chromewebstore.google.com/detail/page-sidebar-open-any-paq/qkkebamcfeaqgmcfciekfakbmlqckdnh>

Step 1 - Install and open the extension

After installation, click the extension icon to open the "Page Sidebar" panel. On first use, it appears blank, with an address field at the top.

[Figure 15 - Newly installed "Page Sidebar" panel, with address field and "Go" button.]

Step 2 - Load DeskFlow

1. In the panel's address field, type or paste: **<https://deskflow-blush.vercel.app/>**
2. Click "Go".

✓ **Result:** DeskFlow is loaded directly into the Chrome side panel, becoming available next to the ticketing system in use.

[Figure 16 - DeskFlow loaded in the Chrome side panel, next to the active ticket.]

14. Sidebar Usage Best Practices

Practice	Benefit
Automatically hide sidebar	Keeps the main ticket screen clean, displaying DeskFlow only when needed.
Pin DeskFlow + AI (ChatGPT/Copilot/Gemini)	Allows you to consult phraseologies and generate responses without switching tabs.
Use Desktop mode in extension (Edge/Chrome)	Ensures better rendering of DeskFlow within the narrow panel.
Review the link after DeskFlow updates	Prevents panels from pointing to older versions if the address changes.

Tip: Whenever possible, prefer Opera for this configuration: by having native support for custom panels, it eliminates the need for third-party extensions and tends to be more stable across browser updates.

*** End of Document ***
